

GFI NETWORK Server Monitor

Automatically alerts & corrects network & server issues

GFI Network Server Monitor is a network monitor that enables administrators to scan the network for failures or irregularities automatically. With GFI Network Server Monitor, you can identify issues and fix unexpected conditions before your users (or managers) report them to you!

GFI Network Server Monitor maximizes network availability by monitoring all aspects of your Windows and Linux servers, workstations and devices (routers, etc). When a failure is detected, GFI's network monitor can alert you by email, pager or SMS, as well as taking corrective action by, for example, rebooting the machine, restarting the service or running a script.

GFI Network Server Monitor actually tests the status of a service, rather than deducing a service status from generated events (as other products do), which is the only real way to ensure server uptime! GFI Network Server Monitor is easy to set up and use, and is competitively priced.

Enterprise class architecture

GFI Network Server Monitor consists of a network monitoring service and a separate management interface. No agent software needs to be installed on the machines you wish to monitor. The Network Monitor Engine is multi-threaded and can run 16 checks at a time. This software architecture allows for high reliability and scalability to monitor both large and small networks.

Includes checks for Exchange 2000/2003, ISA server, IIS and others

Via the Quickstart wizard, you can quickly create a series of checks which monitor all the important services on your network, including Exchange Server, IIS and others. Critical Exchange services and performance counters (Information Store, mailboxes, SMTP service, etc) are monitored.

Features & benefits

Monitor your network and servers for software and hardware failures

Out-of-the-box monitoring of Exchange, ISA, SQL and Web servers

Monitor disk space, services, processes, etc. on servers and workstations

Easy to learn/use and easy to deploy – no client component/agent

Affordable: Monitor 10 servers at \$499 or unlimited at \$999.

Monitors terminal servers by actually logging in

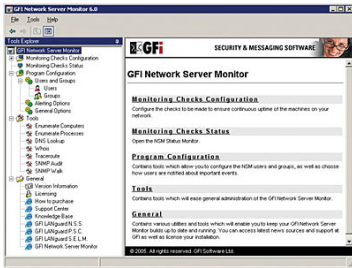

GFI Network Server Monitor can check the status of a terminal server by actually performing a complete login and checking if the session is established correctly. This monitoring method is superior to relying on the events that the terminal server generates (as Microsoft MOM does).

Monitor your database servers (SQL/ORACLE/ODBC)

GFI Network Server Monitor can check the availability of all leading database applications. Out of the box, it can monitor Microsoft SQL Server via ADO and Oracle via SQL*NET. Oracle servers can be monitored by a TNS ping check and by a logon/logoff. Other databases such as Access, FoxPro, Paradox, SyBase, Informix, IBM DB2 and many more can be monitored via ODBC.

Monitor Linux servers

GFI Network Server Monitor includes extensive checks for monitoring Linux servers. You can monitor CPU usage, printer availability, file existence, process running, folder size, file size, users and groups membership, disk partition check and disk space. In addition, administrators can create any check by creating an SSH script.

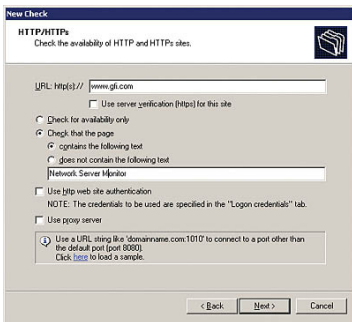

The GFI Network Server Monitor manager

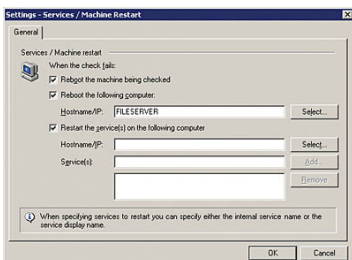

Detailed network resource availability report

Monitor SMTP server function

Monitor HTTP server function

Reboot or restart service upon failure detection

Built-in computer monitor functions

- CPU usage function – Ensure that a processor's usage does not go beyond a certain level
- Performance counter - Monitor any internal operating system counter, including counters used by SQL Server and MSMQ
- Directory size function – Ensure that a particular directory (for example, a user's home directory) does not take up more than x amount of drive space
- Disk drive function – Monitor the physical status of the disk
- Disk space function – Check if sufficient disk space is available
- File existence function – Monitor the existence of a particular file, for example, results of scheduled batch jobs
- File size function – Monitor the size of particular files, for example, critical log files.

Built in Internet service functions

- HTTP function – Checks availability of HTTP and HTTPS sites; passes credentials if required
- Website content checking – Checks website content by specifying a text pattern to check for
- FTP function – Checks availability of an FTP server/site
- ICMP ping function – Checks a remote host for availability
- DNS server function – Checks DNS server by reading an 'A' record and verifying the result
- SMTP server function – Checks mail server by establishing a connection and handshaking to verify SMTP protocol is working correctly
- POP3 server function – Checks POP3 servers by establishing a connection and handshaking
- NNTP news server function – Checks connection and does a handshake
- SNMP function – Monitors specific variables on remote machines or devices via the SNMP GET message
- TCP port function – Checks if a port is responding and checks its response
- UDP function – Monitors UDP ports
- NTP timeserver function – Monitors status of timeservers.

Alert notification via email, pager or SMS

When it detects a failure, GFI Network Server Monitor can send alerts via SMS, pager, email or a network message. SMS (text) messages are sent either through an SMS service provider (SMSC), or directly through a connected GSM phone/modem. All notifications can be customized using variables. Recipients can be configured globally for all rules.

Take corrective action automatically

After an unexpected condition has occurred, GFI Network Server Monitor can automatically correct the problem by restarting a service (or multiple services) upon failure; rebooting a server upon failure; or launching an executable, batch job or VBScript.

View network status from anywhere in the world

You can check rule status from any location using GFI Network Server Monitor's remote web monitor. The remote web monitor includes two types of web page views: One for a normal web browser and one optimized for viewing from a mobile phone or handheld device such as a BlackBerry or a Palm. A small footprint web server is included, although the feature can also be operated in conjunction with IIS.

Monitor remote event logs

GFI Network Server Monitor can scan Windows event logs on local or remote computers and look for specific event sources, categories, event IDs and patterns in the description of the event. In addition, it can look for multiple events occurring in a specific time interval, for example, a McAfee or Norton virus alert posted in the last 30 minutes.

Monitor processes, services performance and CPU usage

GFI Network Server Monitor enables you to check critical processes and services on local and remote computers. You can also monitor the CPU usage of a machine and any performance counter accessible through perfmon.msc. This way, you can ensure that virtually any application is running properly.

Custom network monitoring using VBScript and SSH

Although GFI Network Server Monitor includes an extensive set of default monitoring functions, you can build your own custom checks by writing a VBScript (Windows) or an SSH shell script (LINUX). From VBScript, you can use both WMI and ADSI. WMI is an interface to a broad range of hardware/software/OS-related properties of a computer, allowing you to perform almost any check. Using ADSI, you can interface to Active Directory.

Monitor users, groups and other Active Directory information

Use GFI Network Server Monitor to monitor directory information. For example, monitor group membership of the domain admins group. You can also check user accounts (locked out, disabled, etc.), computer accounts, groups, group membership, organizational units, and so on.

Competitively priced

Network monitoring/management products are traditionally rather expensive. By contrast, GFI Network Server Monitor costs just US\$999 for unlimited monitoring of all workstations and servers (independent of the number of processors) in a network; a ten-server monitoring license costs only US\$499.

Other features

- Configure maintenance periods to avoid alerts being sent during scheduled maintenance
- Advanced logging options to text file or event log
- Configure dependencies to avoid multiple alerts for error conditions dependent on each other
- Monitor network printer status
- Reporting – includes reports that detail the availability of your network resources; alternatively, use Crystal Reports to access the database and create your own reports
- Accommodates employee shifts: GFI Network Server Monitor can notify different people depending on the time at which the check triggered.

You're in good company...

Many leading companies have chosen GFI Network Server Monitor. Here are just a few: Manx Telecom Limited, ABC Fine Wine & Spirits, Satel 2000, The CBORD Group, Inc., and many more.

Reviews

GFI Network Server Monitor named People's Choice Awards 2005 winner - MSD2D, a resource for the Microsoft Exchange, SharePoint, .NET and Security communities, has announced that GFI Network Server Monitor was selected as the 2005 winner in the Security – Server monitoring category of the MSD2D People's Choice Awards. The award was announced at Microsoft's TechEd Fair 2005 in Orlando, Florida. "The fourth Annual People's Choice Awards recognizes the best products and companies in our industry. Visitors to our website cast their vote for the products they view as the very best in their respective category," said Jackie Nguyen, Vice President of Sales. "MSD2D readers are professionals interested in learning more about various solutions for Security in the Server Monitoring category. Their vote serves as a solid peer-to-peer recommendation of the winning product."

- MSD2D.com, June 2005

Silver Award for GFI Network Server Monitor - Reviewer Lee Derbyshire writing for WindowsNetworking.com, awarded GFI Network Server Monitor the silver award rating it 4/5. He was very impressed with the operation of GFI Network Server Monitor. "Like most GFI products it has a simple interface that conceals a lot of powerful options." An interesting feature for the reviewer is the ability to create your own monitoring rules using VBScript if you can't find a built-in rule to suit your needs. The reviewer also found GFI Network Server Monitor reasonably priced, "considering the features on offer".

- WindowsNetworking.com, July 2004

System requirements

- Windows 2000 (SP4 or higher), 2003 or XP Pro.
- Windows Scripting Host 5.5 or higher (Included in Internet Explorer 6 and in Service pack 2 of Internet Explorer 5.5).
